EXPERIENCE

PHP Developer

Jump Twenty-Four Ltd | 06/2021 - Present

I am working within an agency environment and have worked on several projects including the rebuilding of a legacy application from scratch and refactoring old legacy PHP code to use newer Laravel code. Newer technologies were also used in some newer projects, like Inertia for example.

Projects are done to high standards, including implementing a Test Driven Design approach to coding, as well as utilising coding standards where possible.

Daily standups with clients to go through their needs for the project or to discuss how a new feature might be achieved.

Full Stack Developer

Interior Goods Direct | 01/2021 - 06/2021

I was part of a small team that were developing and maintaining multiple systems throughout the business. The company is in the business of selling blinds and curtains as well as many other similar products and many systems have been built to support the processing of these items. I was an addition to the team to help out with building new features and maintaining the current system.

Mostly everything is built using **Laravel** on the backend and **VueJS** is used on the front-end, using pre-built Admin panels and **Bootstrap**.

My role was to learn how the systems work by building features that were not implemented and extend features or help with bug fixes as they come in.

Full Stack Developer

VOODOO | 11/2019 - 11/2020

As the company expanded further -- by opening a UK Development team branch, I was offered a new position as one of the developers to help build, maintain and upgrade new and legacy products and bring them inline using newer technologies and fitting to the correct standards.

I took on the responsibility of rebuilding the VOODOO website (based on a design by an external team). This was built -- from scratch -- using the **Laravel** framework and some front-end frameworks including **VueJS** and **TailwindCSS**.

I was also involved in getting a new infrastructure set up to host the site on. This involved having to create entire stacks using **Docker** which would then be used to deploy as Pods within' the system we used (**Rancher**). I also had to get to grips with **Kubernetes** to work on this new system and learn how to create Pipeline configurations to integrate a deployment strategy when deploying new code.

SKILLS

Laravel

VueJS

TailwindCSS

Docker

PHP

Shell Scripts

NGINX

Linux

Git

WORTHY MENTIONS

TDD | MySQL | CSS (SCSS)
JavaScript | AlpineJS
GitHub | Kubernetes
CI/CD | DevOps

INTERESTS

Gaming

Servers

Side Projects

Wrestling

TV Shows

Podcasts

EXPERIENCE (cont)

Technical Engineer

VOODOO | 02/2017 - 11/2019

- Managed the support help desk for incoming customer queries.
- Introduced a **Git** deployment structure, moving away from FTP deployments, including training current developers.
- Project managed the development of a new **RESTful API** to replace an older version — utilising modern procedures and implementing **PSR** standards. I also wrote the entire documentation.
- Project managed a “sister” website which utilised the above **API** but a different white label.
- Implemented **Docker** to build monitoring tools for services used internally.

Technical Support Engineer

aq Ltd | 04/2016 - 02/2017

- Customer support via ticketing system and telephone
- Building bash scripts to make API usage easier
- SIP Wholesale Management
- Managing an SMS platform
- Using Atlassian tools (Jira/Confluence)
- Domain/DNS Management

* Further work history available on request or via LinkedIn

EDUCATION

THOMAS DANBY COLLEGE (2001-2003)

- GNVQ IT Lv. 1
- GNVQ IT Lv. 2

WORTLEY HIGH SCHOOL (1996-2001)

- GSCE (English, Maths, Science, Graphic Design, IT)
